Solution

Try below options to solve the issue.

Option 1: Confirm there is enough disk space on the system

Check that your system's `temp` directory is located on a disk with enough free space. You can view and change where your `temp` directory is pointing to by going to **Control Panel > System > Advanced System Settings > Environment Variables**, then under **User Variables** and **System Variables** look for **TEMP** and **TMP**.

Option 2: Reboot the system

Rebooting will clear up the available address space available on the machine, which is usually what causes this error.

Option 3: Unzip the self-extracting installer executable

Use 7-Zip or another extractor application to extract the contents of the installer package into a local folder.

Simply right click the DeskPack Installer `.exe` and choose to extract the files to a folder on your hard drive.

Once the files are extracted, go to the folder you extracted the files to and right click to run the `setup.exe` as 'Admin'.

Option 4: Re- Download the DeskPack

It may be possible that the DeskPack Setup package was not fully downloaded and is corrupt. Try downloading the package again.
